STACKSCROLL

Presenter and Private Alpha Test Guide

How the feed works, how a Stack becomes a learning loop, how to demonstrate it, and what can be tested offline.

THE ONE-SENTENCE EXPLANATION

StackScroll turns a continuous technology feed into intentional learning: users discover useful ideas, assemble them into weighted topic Stacks, practice them in short guided sessions, and return later for recall.

PRIVATE ALPHA / SEPTEMBER 2026

Audience: early testers, collaborators, educators, and potential partners. This guide describes the current build, not a promise of future functionality.

Presentation cue

Do not begin by listing features. Begin with the problem: endless feeds are excellent at holding attention but poor at helping people build a coherent body of knowledge. StackScroll keeps discovery fluid, then gives useful discoveries somewhere to go.

The Stack process

A Stack is a deliberate learning lane built from connected topic layers. It is not a playlist and it is not a claim of mastery.

01	**DISCOVER** A card, story, question, video, or tool catches the user's attention.
02	**ASSEMBLE** The user names a Stack, states its purpose, selects topic layers, and gives each layer an emphasis.
03	**MIX** A deterministic weighted scheduler interleaves eligible cards. Main-focus layers appear earlier and more often; supporting layers remain represented.
04	**PRACTICE** A guided Stack moves through situation, concept, attempt, reasoning, and wrap-up.
05	**RECALL** Completion can schedule a later recall. The app records activity separately from mastery.

What emphasis means

Supporting (1), Balanced (2), and Main focus (3) influence ordering. They do not fabricate content, duplicate a card, or remove a selected supporting topic. Exclusions remove specific cards from that Stack.

What a Stack is not

It is not a certification, transcript, recommendation from a licensed instructor, or proof that someone understands a topic. Stats describe activity and recall events only.

Inside a five-step guided session

Each session has a deliberate stopping point. The design favors one useful loop over an endless course outline.

01 / THE SITUATION

A concrete scenario creates a reason to care.

02 / UNDERSTAND

A source-linked concept explains the key distinction.

03 / TRY IT

A question requires an answer, not passive scrolling.

04 / THE REASONING

Feedback explains why an answer is supported.

05 / WRAP UP

The learner closes the loop and may schedule recall.

How to explain the learning logic

+ Discovery supplies curiosity.
+ The Stack supplies structure.
+ The question supplies effort.
+ Reasoning supplies feedback.
+ Recall supplies another encounter after time has passed.

> Suggested line: *'The Stack does not certify knowledge. It creates a small, repeatable path from interest to retrieval.'*

How the feed algorithm behaves

The current feed is a private-alpha discovery system. It balances several signals while deliberately preserving outside-topic discoveries.

SIGNAL	CURRENT ROLE
Active Stack	Strongest guide for topic layers and exclusions.
More / less feedback	Raises or lowers topic priority.
Basic / advanced feedback	Changes the preferred difficulty within a topic.
Pinned topics	Adds a preference boost.
Saved-card topics	Optional, smaller boost; applies after refresh.
Diversity controls	Separate nearby repetitions and keep discovery outside the current Stack.
Seen-card memory	Rotates already-seen items without treating watching as learning.

The guardrail

Personalization should become noticeable without becoming narrow. A successful test feed reflects repeated engagement, preserves category balance, and still produces occasional useful surprises.

What to measure

+ Topic and publisher distribution in every 20-30 cards.
+ Open, save, dismiss, answer, video-start, and Stack-completion behavior.
+ How quickly content feels repetitive.
+ Whether a user can explain why a recommendation appeared.

Seven-minute presentation script

Use the app as the visual; use these lines as the narrative.

0:00-0:45	**Problem** 'Most feeds optimize for another swipe. StackScroll gives useful discoveries a place to become structured learning.'
0:45-1:45	**Discover** Scroll several cards. Point out source links, formats, topics, saves, and the continuous feed.
1:45-3:00	**Build a Stack** Open Stacks. Name the goal, choose layers, explain emphasis, preview the mix, then activate it.
3:00-4:15	**Follow the feed** Return to Discover. Show that the active Stack shapes the mix without eliminating discovery.
4:15-5:30	**Practice** Open a guided Stack. Move through situation, concept, question, reasoning, and wrap-up.
5:30-6:15	**Recall and stats** Open Lab, then Profile. Explain that completion, accuracy, and recall are activity signals, not credentials.
6:15-7:00	**Offline test** Disconnect after installing/visiting once. Reopen the app and show bundled content, device profile, saves, and local Stack progress.

Avoid saying

+ 'The algorithm knows what you need.'
+ 'Finishing a Stack proves mastery.'
+ 'Everything works offline.'
+ 'All external articles and images are owned by StackScroll.'

Testing without a server

Offline test mode is designed for one browser on one device. First load the private app while connected so its shell and assets can be stored.

WORKS OFFLINE	REQUIRES A CONNECTION
Bundled card library and original practice	Fresh news and remote source updates
Continuous browsing, filters, and search	YouTube thumbnails and video playback
Device-local saves and learning state	Cross-device profile or progress sync
Guided Stack sessions and scheduled recall	Account-backed recovery on another browser
Custom Stack drafts and active mixes	Opening external source links
Profile photo, bio, focus, and stats	Server telemetry and remote diagnostics

Offline test procedure

+ Open the private site once while connected and wait for the first feed to render.

+ On iPhone Safari, use Share > Add to Home Screen for the most app-like launch.

+ Close and reopen once while connected, then enable Airplane Mode.

+ Open StackScroll from the saved icon and test bundled content, saves, profile, custom Stacks, and guided progress.

+ Reconnect before testing fresh sources, videos, external links, or account synchronization.

> Important: clearing website data, using private browsing, or removing the browser profile can erase device-local test data.

Profiles, stats, and test protocol

The private-alpha profile is intentionally device-local. It provides identity and progress context without pretending cloud accounts are finished.

Profile fields

+ Display name, learning focus or role, short bio, and a square profile photo.

+ Photos are cropped and compressed on the device before storage.

+ Profile details are not synchronized to another browser or device.

Stats shown

+ Saved cards, completed cards, quiz accuracy, completed guided Stacks, and completed recalls.

+ Counts describe activity. They are not grades, certifications, or validated skill assessments.

Recommended private-alpha test

WEEK 1	5-10 testers. Observe onboarding, scrolling, first save, first Stack, and profile setup.
WEEK 2	Review topic balance, repetition, loading errors, offline reopening, and whether testers can explain a Stack.
DECISION	Tune the feed only from repeated behavior and clear failure patterns, not one person's isolated preference.

Ask every tester

What did you think a Stack was before using it? What do you think it is now? When did the feed feel relevant? When did it feel repetitive? What would you expect to survive offline or move to another device?

Before expanding the rollout

Use this as the go/no-go review for a broader private alpha.

[ ] EXPLANATION

A new tester can describe Discover -> Stack -> Practice -> Recall in their own words.

[ ] OFFLINE

The installed app reopens without connectivity and clearly labels device-local storage.

[ ] FEED

A 20-30 card sample is balanced enough to avoid obvious topic or publisher clusters.

[ ] MEDIA

Unavailable thumbnails and embedding failures show useful fallback messages.

[ ] PROFILE

Photo, fields, and stats persist after closing and reopening the app.

[ ] PRIVACY

Testers understand what remains on-device and what requires account services.

[ ] RIGHTS

Each third-party image and source retains its attribution and license record.

Final rollout checks

Three operational checks complete the private-alpha review.

[ ] PERFORMANCE

Scrolling, video unload, nano motion, and page transitions remain smooth on target phones.

[ ] RECOVERY

Clearing test data and restoring a fresh test state are documented.

[ ] FEEDBACK

There is one place to collect issue type, device, steps, expected behavior, and actual behavior.
